

Week 4

1. Implemented Pydantic models for strict validation of incoming job payloads.
2. Enforced field constraints:
 - count between 1–10
 - Non-empty requestId
 - Valid attributeName enumeration
 - Proper S3 URI format
3. Implemented structured error responses for malformed requests.
4. Integrated validation directly into the worker processing pipeline to fail fast before AI execution.
5. Added consistent logging of validated job metadata for traceability.
6. Created a standardised response schema for the status queue.
7. Conducted validation testing with intentionally malformed payloads to ensure resilience.
