

Week 5

1. Implemented S3Manager abstraction for:
 - Avatar download
 - Generated image upload
 - URI parsing
2. Integrated Tenacity retry logic for handling transient S3 failures.

Supported both:

- Explicit AWS credentials (local dev)
 - IAM instance profiles (production EC2)
3. Structured S3 upload paths for generated images using:
generated/{userId}/{requestId}/image_X.png
 4. Implemented secure handling of AWS credentials via environment variables.
 5. Added logging for S3 operations, including file size and upload confirmation.
 6. Validated full round-trip: download avatar → process → upload generated image.
