

Week 11

1. Focused on preparing detailed project documentation and consolidating all implemented components into a well-structured format.
2. Created architecture diagrams representing the event-driven system, including BullMQ queues, Redis caching, S3 storage, and AI image generation flow.
3. Documented API payload structures, request-response formats, and system workflows.
4. Organised codebase with proper comments and modular structure to improve readability and maintainability.
5. Prepared technical documentation covering setup instructions, dependencies, and configuration details.
6. Also started drafting experimental observations based on testing results, such as processing time and system efficiency.
7. Ensured that all modules were clearly explained for future reference and evaluation purposes.
