

WEEKLY LOGS

27 Mar 2026

Week 9

1. Focused on optimising system performance and improving efficiency of the image generation pipeline.
2. Analysed processing time for each stage and identified bottlenecks such as repeated S3 downloads and API delays.
3. Improved caching strategy to maximise cache hits and reduce redundant operations.
4. Optimised queue processing flow to handle multiple requests efficiently while maintaining system stability.
5. Enhanced retry mechanisms using libraries like Tenacity to handle transient failures in external services.
6. Improved logging and monitoring to capture performance metrics such as processing time and success rates.
7. Conducted stress testing by sending multiple concurrent requests to evaluate system scalability and reliability.
