

WEEKLY LOGS

20 Mar 2026

Week 8

1. Worked on integrating all major components of the system into a unified pipeline.
2. Connected the queue-based processing system with S3 storage and AI image generation modules to ensure smooth data flow from input request to final output.
3. Implemented end-to-end testing where requests are pushed to the queue, processed by the worker, and results are stored and returned correctly.
4. Enhanced monitoring by using status consumer scripts to track job progress in real time.
5. Verified Redis caching behavior to ensure cached avatars are reused efficiently.
6. Performed multiple test scenarios including different avatar attributes and batch image generation requests.
7. Improved system stability by handling edge cases such as missing files, invalid inputs, and failed API responses.
